

Abstract

A container made of a flexible, durable and pliable material is disclosed. The container can hold bulky and odd shaped packages. In a preferred embodiment it is roughly cubic in shape and can be folded up into a compact unit when not in use for storage or transportation and deployed when needed. A variation of the container has pockets to receive rigid sheets to form the container into an upright case with reinforced sides. These sheets can be removed and the whole unit packed into a compact unit for storage and transport. The handles are placed on the container to reinforce it and facilitate movement of the container. Additionally, a strap based carrying device is disclosed to facilitate the carrying of boxes.
